

IN THE ABSTRACT

Please delete the Abstract and insert the following Abstract:

A1 --A liquid ejection print head includes a base accommodated in a frame and having electrothermal transducers supplied with energy from an external source for heating liquid to eject the liquid to effect printing, a conductive layer for forming an electrical wiring, and a tape member for supporting the conductive layer and having connecting portions electrically connected to the transducers via electrode portions on the base. The connecting portions include branch portions and reinforcement portions which are more rigid than the branch portions so as to prevent deformation of the branch portions.--
